

Privacy Policy — yt-factory

Last updated: 4 October 2026

What this is

yt-factory is a private, automated publishing tool that its owner runs for a single YouTube channel of their own. It is not a product, not a service, and not offered to anyone else. It has no sign-up, no login screen and no user interface. The source code is public so that what it does can be checked; the running instance belongs to one person.

Who uses it

One person: the owner of the YouTube channel it publishes to. There are no other users, and no mechanism by which another person could become one. Nothing in this policy is a promise to third parties about their data, because the application never receives any.

What it collects

From other people: nothing. The application has no interface through which anyone could submit information, collects no analytics, sets no cookies, serves no pages, and has no visitors. This page itself is static and sets no cookies.

From the owner's own Google account, after the owner grants access in a browser: an OAuth refresh token limited to the single scope `https://www.googleapis.com/auth/youtube.upload`. That scope allows uploading a video and setting its thumbnail on the owner's channel. It does not allow reading, editing or deleting anything on the channel, and it gives no access to the owner's identity, e-mail address, contacts, viewing history, or any other Google service.

The token is stored in two places: on the owner's own computer, and as an encrypted GitHub Actions secret in the owner's repository. It is never written to the repository, never printed in logs, and never sent anywhere except to Google.

What it stores

A SQLite database in the repository, holding only what the application itself produced: the topics and scripts it wrote, the scene text, the identifiers and scheduled publication times of the videos it uploaded to the owner's channel, and a log of its own runs. No personal data of any person is stored in it, and this has been checked before each publication.

What it does with YouTube data

It calls exactly two YouTube Data API endpoints, `videos.insert` and `thumbnails.set`, and only against the channel that authorised it. It reads no YouTube data, stores none beyond the video identifiers of its own uploads, and passes none to anyone. It does not sell data, does not use it for advertising, and does not use it to train any model. It does not simulate a viewer and never generates views, likes, subscriptions or comments.

Content

Videos are produced automatically. The narration is synthetic speech and the artwork is generated, and every upload declares this to YouTube with `status.containsSyntheticMedia = true`. Every upload also declares `status.selfDeclaredMadeForKids = false`. Background music is licensed CC0, with the source of each track recorded in the repository.

Third parties

To do its work the application sends text to a language model provider and an image generation provider, and sends the script's text to a text-to-speech service. What is sent is the content the application itself wrote for the video. No personal data is sent, because it holds none.

Required disclosures for YouTube API clients

- This application uses YouTube API Services.
- By using it, the owner agrees to the [YouTube Terms of Service](#).
- Google's privacy policy is at <https://policies.google.com/privacy>, and it explains how Google handles data.
- The owner can revoke this application's access to their Google account at any time from the [Google security settings page](#). Revoking access stops the application immediately and permanently.

Retention and deletion

The stored data is the application's own records of what it produced. The owner can delete all of it at any time by deleting the repository and the local copy, which leaves nothing behind except the videos already published on the channel.

Changes

Any change to this policy will be a commit in the public repository, so its full history can be read at github.com/beautyapp800-ctrl/yt-factory-daily.
